

Class: Main

Creates a Controller object with the required files.

**Class: Controller**

self.blankReport() → create output folder, and empty files inside that we later update
participantDict(profiles) → Takes out important info from participant csv file

Loop through dict and create participants
Creates a Fitness object, which orchestrates the main analysis

**Class: Fitness**

Stores participants as a list
Creates empty badRecords list
Creates empty rows list

csvDataToList()

- Reads the CSV file
- Validates required fields and identifiers (regex)
- Converts values to the correct types
- Adds rows with errors to badRecords

rowValidator() →

- Checks that measurements are logically valid
- Checks that values are within their expected ranges
- Adds invalid rows to badRecords
- Returns the list containing valid rows

assign_rows_to_participants() →

- Assigns the row to the participant

Loop through participants:

- participant.createSessions()
- Loop through sessions
- create Datahandler object
- ReportInterface - Objects to write report to file

ReportInterface → object to write error-report to file
FinalPrint() → Simple summary output

Class: Participant

Stores participant values →
name, participant_id,
baseline_heart_rate,
baseline_skin_response,
baseline_temperature

observations = []

createSessions()

Class: Session

valid session rows
ID

Class: DataHandler

Calculates a dictionary with values for the final report.
